

RF EAVES

RF Eaves Rain Guards Stop Rubber Yield Loss

INTRODUCTION

Rain interference results in tapping days loss, washouts or late tapping. These can affect profitability if no control is adopted.

As much as 42% of the total rain days may interfere in some ways with tapping operation and crop loss can be as high as 12% per annum and most of it during the high cropping months.

RF EAVES is a rain guard system developed in 1981 to minimize crop losses during rainy days. **RF EAVES** is an effective product designed as a hood to prevent water flowing down the trees and keeps the panel dry. This enables tapping to be carried in most of the days affected by rain interference.

BENEFITS OF RF EAVES

- Increases the number of tapping days.
- Increases crop harvest.
- Yield stimulation is more effective with increased tapping outturn.
- Delays washout of latex from the cups.
- Eliminates double tapping.
- Improve nett returns.
